BRAC UNIVERSITY

Quiz 1 **Department of Computer Science and Engineering**

CSE110: Programming Language I Duration: 40 minutes Marks: 20

Name: (Please write in CAPITAL LETTERS)	ID:	Section: 30

1. Write a python program that will at first take how many items a customer will buy from a shop. Then take the price of all the items from the user. The customer will get a 5% discount only on those items whose price is divisible by 2. Print the actual price and the price after the discount. [Marks 10]
   . [CO 3 + CO 4]

Sample Input 1:

5

45

44

875

34

89

Sample Output 1:

Price before discount: 1087

Price after discount: 1083.1

Explanation:

As the user enters 5 as an input, that's why the program should ask the price of 5 items from the user. The total cost of the items is 45+44+875+34+89 = 1087. After applying a 5% discount only on those items whose price is divisible by 2, the discounted price is 1087 - (44+34) x 5% = 1087 - (78 x 5%) = 1083.1

2. Trace the below table and write the outputs in the given boxes. You MUST show the trace table. [Marks 10] [C0 3 + CO 4]

1	`p, j , k = 0 , 20, 70`
2	`while (k > 5):`
3	`  while ( j < k ):`
4	`    p = k + j -35`
5	`    print(3 + int (p / 2))`
6	`    j += 10`
7	`  k -= 15`
8	`print(True and (False or not True) or not False)`
9	`print(j % 7 + 2)`
10	`print(k > 9 == False)`
11	`print(p == 45)`
12	`print(14/7 + 3)`

Output
